Re: Request for Information: Detroit Housing Resource Helpline

Dear [Buyer name]:

Integrated Efficiency Business Consultants, LLC (IEBC) and our partner, Handled Services LLC, thank the City for the chance to share market insight on the Detroit Housing Resource Helpline. Both firms are based in Detroit.

- **IEBC** designs and builds AI-assisted business systems: intake and triage logic, multi-channel messaging, dashboards, integrations, and the controls that keep humans in charge of automated tools.
- **Handled Services** runs a Detroit network of vetted, insured service professionals for cleaning, cleanouts, hauling, repairs and licensed trades. It books, dispatches and verifies work through its own digital intake and tracking platform.

We respond to both tracks:

- **Technology/Integration:** a full answer. We propose a cloud contact center on a commercially certified platform, a configurable screening and referral layer, closed-loop data exchange with City and partner systems, and assistive AI governed by the City's AI Factsheet. The AI can be switched off feature by feature.
- **Operation:** a proposed approach and staffing model for 120,000 calls a year with 1,500-call peak days. We are candid that we expect to deliver operations with an established contact-center partner, not alone.
- **Referral endpoint (Handled):** a way to close the loop on referrals. When a caller's housing stability depends on a physical service, such as a move-out cleanout, an emergency repair, pest treatment or code-compliance work, the Helpline can hand the referral to Handled. The City then gets back the quote, the schedule and photo-verified completion. Today that outcome is usually lost after the call.

We hope this is useful as the City shapes its RFP(s). We would welcome a follow-up conversation or a demonstration.

Respectfully,

Mark Odom
Founder & CEO, Integrated Efficiency Business Consultants, LLC
[phone] · [email]

[street] · Detroit, Michigan 48219
[phone] · [email] · [website]

Executive summary

What residents need: one call, a fast answer, the right referral, and a follow-up when they called after hours.

What the City needs:

- Screening logic it can change in 24 hours.
- Data that reaches programs without re-keying.
- Metrics it can trust.
- A platform that doesn't go down on a 1,500-call day.

What we recommend:

Need	Our approach
Reliability (99.99%, 15-min RTO, 30-min RPO)	Build on a cloud contact-center platform that publishes a 99.99% service commitment and has active-standby across two US regions. We don't build or host telephony ourselves.
Keep 866-313-2520	Toll-free number ported to the new platform at a scheduled cutover, with the current carrier as fallback until verified.
Screening that changes fast	Screening scripts kept as versioned, no-code decision trees, with edits by an approved City or operator admin. Emergency changes go live within hours, logged and reversible.
Multilingual	Recorded greetings and menus in English, Spanish, Arabic and Bengali, Spanish- and Arabic-speaking agents, a contracted interpreter line for every other language, and translated texts and emails.
High-volume days	Callback-in-queue, self-service resource texts, staffing by forecast, and a surge plan, so callers aren't left on hold for more than 5 minutes.
Data handoff	One intake record per caller, sent to programs by API, secure file transfer or Salesforce integration, with an audit trail and a single named system of record for each data element.
AI	Assistive only: transcription, summaries, language detection, quality-assurance (QA) scoring, and agent knowledge search. Eligibility and referral decisions stay with trained staff. Every AI feature can be switched off.
Closing the loop	Partner endpoints, starting with Handled, return referral outcomes (accepted, scheduled, completed, with photos) to the case record.

Attachment A: Respondent Questionnaire (Part 1)

A-1. Contact information

Single point of contact

Field	Response
a. Name	Mark Odom
b. Title	Founder & CEO, IEBC
c. Address	[street], Detroit, MI 48219
d. E-mail	[business email]
e. Phone	[one number]

Partner or manager in charge if awarded

Field	Response
a. Name	Mark Odom (program executive). [Add operations lead or teaming-partner project manager when named.]
b. Title	Founder & CEO, IEBC
c. Address	[street], Detroit, MI 48219
d. E-mail	[business email]
e. Phone	[one number]

A-2. Respondent background (complete for each party)

Item	IEBC (respondent)	Handled Services LLC (partner)
a. Legal name	Integrated Efficiency Business Consultants, LLC [confirm against state filing]	Handled Services LLC
b. Principal place of business / place of performance	[street], Detroit, MI 48219. Work is performed in Detroit and remotely.	[street], Detroit, MI [ZIP]. Services are performed in Detroit and Wayne County.
c. Entity type	Limited liability company [confirm]	Limited liability company
d. Tax status / FEIN	[ ]	[ ]
e. State formed	Michigan [confirm]	[Michigan]
f. Company phone	[one number]	(313) 639-9373
g. Website	[IEBC website]	handledsvc.com
h. Years in business	Founded 2025. The founder has led sales and marketing operations since 2001.	Founded 2026.

Item	IEBC (respondent)	Handled Services LLC (partner)
i. Average employees, last 3 years	[2024: n/a · 2025: __ · 2026: __]	[2026: __ staff plus __ independent service professionals]
j. City of Detroit contracts, last 5 years	[None]	[None]
k. Claims or lawsuits from services, last 10 years	[None]	[None]
l. Contracts terminated	[None]	[None]

[If under common ownership, keep: IEBC and Handled Services LLC are under common ownership [confirm]. Handled operates on systems IEBC designed.]

A-3. Prior experience

"IEBC and Handled are early-stage Detroit firms. We do not yet have a completed public-sector contact center of this size, and we won't present unrelated work as if it were. For an RFP, we intend to respond as part of a team led by, or including, an operator with documented public-sector helpline experience, and to provide three references that meet the City's standard. Today we can show the systems described in this response working live (Handled's intake, dispatch, messaging and QA platform), and we welcome a demonstration."

Reference Form #1 [Teaming partner public-sector helpline, if available]: fields a–j. **Reference Form #2** [IEBC client project: systems, automation or messaging]: fields a–j. **Reference Form #3** [Handled commercial account or referral partner]: fields a–j.

A-4. Subcontractors

Question	Response
Do you intend to use subcontractors?	Yes, for an RFP. • **Handled Services LLC** ([address]): referral endpoint for physical housing-stabilization services (cleanouts, move-outs, repairs, pest, water damage, locksmith, snow and lawn for code compliance), with photo-verified outcomes returned to the case record. • **[Teaming partner]**: contact-center operations, agent staffing and supervision. • **[Interpreter service]**: on-demand phone interpretation for languages not covered by staff. • **Cloud platform providers** (e.g., Amazon Web Services; Salesforce if the City selects it) are used as licensed services, not subcontracted labor.

[street] · Detroit, Michigan 48219
[phone] · [email] · [website]

Part 2: Call Center Technology/Integration Questionnaire

T-1. Implementation timeline

A 16-week plan from contract signature to go-live, plus 4 weeks of hypercare. The timeline depends on City access to the current carrier and the toll-free number's carrier of record, and on prompt approvals.

Weeks	Phase	Key outputs
1–3	Discovery	Current-state call flows, CAM intake requirements, script inventory, integration and data inventory, security requirements. Port request for 866-313-2520 begins.
4–6	Design	Solution architecture, data-flow diagram, IVR and routing design, screening decision trees, reports, AI Factsheets. City approves security design.
7–11	Build and configure	Contact center in two regions, IVR in 4 languages, routing and callback, case and intake forms, integrations, messaging, dashboards, single sign-on (SSO) and multi-factor authentication (MFA).
12–14	Testing	Functional, integration, load (2× peak: 3,000 calls/day; 300 calls/hour), failover/DR drill, accessibility, penetration test, user acceptance testing (UAT) with City and partner staff.
15	Training and readiness	Agent, supervisor and admin training. Go/no-go checklist.
16	Cutover	Number port during a low-volume window, parallel monitoring, rollback plan.
17–20	Hypercare	Daily defect triage, weekly tuning of scripts and staffing, handover to steady-state support.

T-2. QA: reviewing, flagging, scoring and auditing interactions

- **100% of calls recorded and transcribed**, then stored with the case record under the City's retention schedule.
- **Automated screening of every call** to flag calls for human review:
  - Long holds, transfers, abandoned callbacks, or caller distress or escalation words.
  - Required screening questions that were missed (e.g., the CAM safety question, secondary-needs screening).
  - Mentions of eviction dates, utility shutoffs or no safe place to sleep tonight, so urgent cases are confirmed as routed.
- **Human-scored QA form:** a City-approved scorecard covering greeting, eligibility accuracy, complete screening, referral accuracy, empathy, privacy and documentation.
  - QA analysts score a random sample of at least 3% of calls per agent per month.
  - They also score 100% of flagged calls.
- **Calibration:** monthly sessions with City staff, and agreement between scorers tracked over time.
- **Reporting to the City:** a monthly QA report covering scores, trends, findings, corrective actions and coaching completed, with evidence. Corrective-action items are tracked to closure.
- **Audit:** every score, flag, recording access and export is logged with user and time.

[street] · Detroit, Michigan 48219
[phone] · [email] · [website]

T-3. Tracking and reporting metrics

- **Dashboards:** a live operations wallboard, plus a City dashboard refreshed every 15 minutes and published to Tableau (or the City's BI tool).
- **Data path:** contact-center events, case records and messages land in a reporting warehouse. If the City uses Snowflake, the data is delivered there.
- **Required metrics:**
  - Call volume.
  - Calls received and handled.
  - Wait time.
  - Handle and processing time.
  - Call reasons and outcomes.
  - Resources shared.
  - Direct referrals made.
  - For referral partners, referral outcomes.
- **Standard reports:** daily (operations), weekly (City program staff) and monthly (performance and QA).
- **Self-service:** City staff can build their own Tableau views from a documented, de-identified data model.

T-4. Solution architecture

Layer	Proposed component (reference design)	Notes
Telephony / contact center	Amazon Connect (or equivalent CCaaS: Genesys Cloud, Twilio Flex), active-standby across two US regions	Inbound and outbound voice, queues, skills-based routing, callback-in-queue, recording. 866-313-2520 is ported to it.
IVR	Contact-flow IVR with recorded prompts in English, Spanish, Arabic and Bengali	Language selection, emergency shortcut (e.g., "if you have nowhere safe to sleep tonight, press 1"), after-hours routing, callback offer.
Agent desktop and case / intake	Salesforce Service Cloud (if the City selects it), or a configured intake application on a SOC 2 platform	Screening decision trees, caller record, referrals, notes, consent. Single sign-on for agents.
Screening / rules engine	Versioned no-code decision trees	Change control for both 7-day and 24-hour changes, with an audit trail.
Messaging	SMS, email and voice broadcast through the platform's messaging service	Opt-in and opt-out (TCPA), templates in 4+ languages, resource-inventory messages.
Knowledge base	Curated housing resource inventory with owners and review dates	Feeds agent search and resident texts and emails.
Integration layer	API gateway plus event and file pipelines (REST, SFTP, platform connectors)	To Smartsheet, Snowflake, Salesforce, Google Workspace, Corteza/Pathways, SeeClickFix, Accela, and partner endpoints (Handled).
Reporting	Warehouse (Snowflake or equivalent) plus Tableau	Near-real-time operations data and historical data.

Layer	Proposed component (reference design)	Notes
AI (optional, switchable)	Transcription, call summary, language detection, QA flags, agent knowledge search	See T-11 and T-12.
Identity and security	City identity provider (SSO with SAML or OIDC) and MFA. Encryption with KMS, centralized logging and SIEM.	See T-9 and Section 5 alignment.
Third parties	[Interpreter service], [CCaaS], [CRM], [messaging], Handled Services (referral endpoint)	All listed in the security plan with data-processing terms.

T-5. Data-flow diagram

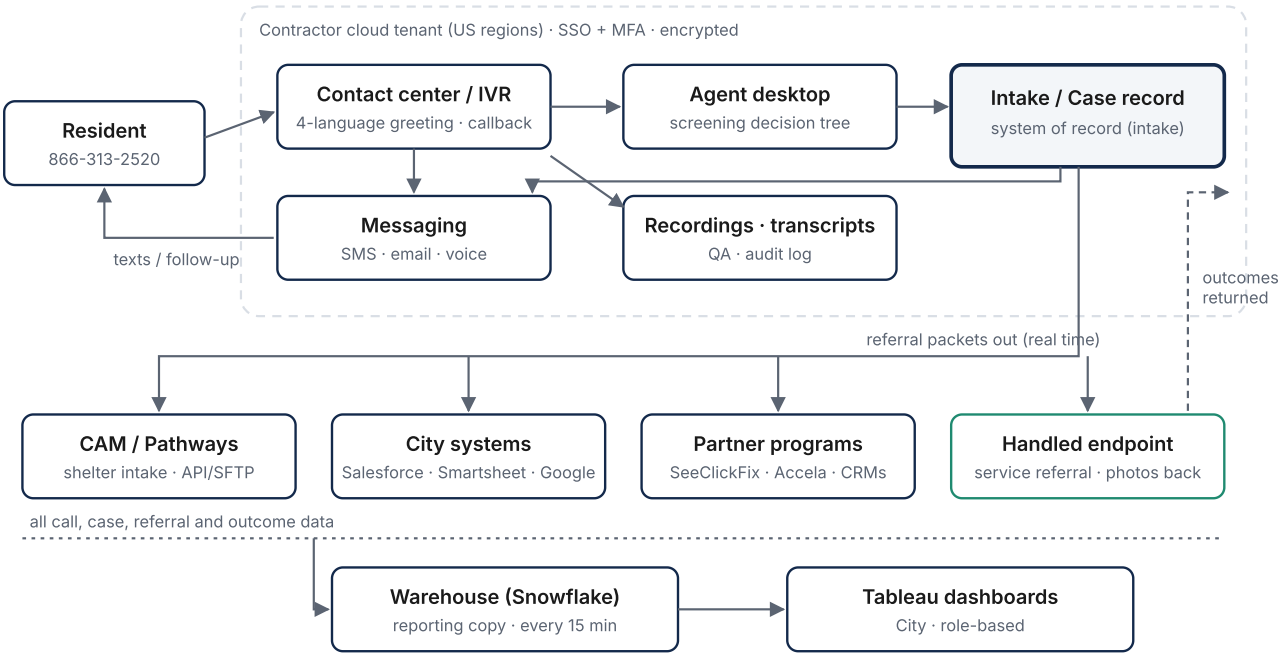

Figure 1. Data flow. Each numbered flow is detailed in the table below.

#	From → To	Data	Direction	Method	Frequency	Security boundary	System of record
1	Resident → contact center	Voice, DTMF input, language choice	Inbound	PSTN, toll-free	Real time	Carrier → CCaaS (US regions)	CCaaS (call detail records)
2	Contact center → agent desktop	Caller ID, IVR choices, queue data	One-way	Native connector	Real time	Within the contractor's cloud tenant	Intake/Case
3	Agent → intake/case	Screening answers, needs, consent, notes	Write	UI	Real time	Contractor tenant, SSO and MFA	**Intake/Case**

#	From → To	Data	Direction	Method	Frequency	Security boundary	System of record
4	Intake → CAM / Pathways	Shelter intake record	Outbound, with status back	API or SFTP (whichever Pathways supports)	Real time or every 15 minutes	Contractor → City/CoC system, TLS 1.2+	Pathways (for CAM)
5	Intake → City programs (Salesforce, Smartsheet, Google)	Referral packet	Outbound, with status back	API	Real time	Contractor → City tenant	Receiving program
6	Intake → Handled	Service referral (minimum necessary: name, phone, address, need, consent)	Outbound, with outcomes back	REST API (signed requests)	Real time	Contractor → Handled tenant	Handled for the job; intake for the outcome summary
7	Messaging → resident	Resource lists, follow-ups, reminders	Outbound	SMS, email, voice	Event-driven	Contractor tenant → carriers	Messaging log
8	All → warehouse	Call, case, referral and outcome data	One-way	Pipeline	Every 15 minutes, plus nightly	Contractor → City Snowflake (or contractor warehouse)	Warehouse (reporting copy only)
9	Warehouse → Tableau	Aggregates and row-level data (role-based)	One-way	Connector	Every 15 minutes	City BI	n/a
10	Field updates (SeeClickFix, Accela)	Inspection or code-issue referrals	Outbound, with status back	API	Real time	Contractor → City	SeeClickFix / Accela

T-6. Hosting and deployment

Item	Proposed
Model	Software-as-a-service: a multi-tenant cloud contact center with a dedicated, logically isolated City instance, account and encryption keys.
Cloud provider	Amazon Web Services (reference design). Salesforce (Hyperforce, US) if Service Cloud is selected.
Regions	Primary US-East, standby US-West. All data stays in the US.
Data residency	United States only, including backups, recordings, transcripts and AI processing.
Environments	Development, Test/UAT and Production, each separate with no production data in lower environments (synthetic data only).
Hosting subcontractors	None beyond the cloud and SaaS providers named above. All are listed, with their SOC 2 Type II reports available to the City under NDA.

T-7. Capacity

Measure	Platform limit (reference design)	Proposed configuration
Maximum agents	Thousands; scales on demand	60 agent seats licensed (peak plus surge plus training)
Concurrent calls	Hundreds to thousands (quota-based; raised on request)	Configured for 150 concurrent calls
Calls per hour	Scales with concurrency	Load-tested to 300/hour (2× projected peak hour)
Queue size	Configurable	200 callers in queue, with automatic callback offer after 2 minutes
Callback volume	Configurable	1,000+ pending callbacks per day
Outbound messages	Throughput by registered number type (toll-free / 10DLC)	10,000+ SMS/day and unlimited email. Registration completed during implementation.
Storage	Object storage, effectively unlimited	Recordings and transcripts kept per the City retention schedule (proposed 3 years active, then archive)

T-8. Speed and service metrics

All of these are captured automatically for every interaction and reported by queue, language, hour and agent:

- Average speed of answer.
- Abandonment, total and after 30 seconds.
- Wait time: average, 90th percentile and maximum.
- Handle time: talk, hold and wrap-up.
- Hold time.
- Transfer rate.
- Callback performance: offered, accepted, completed, time to callback, and first-attempt success.
- Service level: % answered or called back within 5 minutes (City target).

T-9. Protecting City Internal, Confidential, Restricted and PII data

- **Classification:** each data field is tagged (Internal, Confidential, Restricted, PII). Restricted data, such as domestic-violence indicators and health information shared by callers, gets field-level access restrictions.
- **Minimum necessary:**
  - Referral packets carry only the fields the receiving program needs.
  - Partner endpoints, including Handled, never receive screening detail they don't need.
- **Encryption:**
  - In transit: TLS 1.2 or higher.
  - At rest: AES-256, with keys in a managed key service (AWS KMS), rotated every year. Customer-managed keys are available to the City.
  - Limitations are disclosed, e.g., the carrier network carries voice before it reaches the platform.
- **Access:**

  - City SSO with MFA, a unique account for each user, and role-based groups.
  - Least privilege, with access reviewed every quarter.
  - Administrator timeouts and break-glass accounts.
  - Accounts disabled within 24 hours of separation, through the account lifecycle process.
- **Monitoring:**
  - Centralized logs, alerting and a 24×7 on-call rotation.
  - Incident response plan with City notification within [24] hours of a confirmed incident.
- **Vulnerability management:** monthly patching (critical within 72 hours), malware protection on agent endpoints, and an annual third-party penetration test.
- **Payment card data:** none. No payments are taken by phone.
- **Audit logs:** searchable, tamper-evident, and kept [7] years. They cover:
  - Access and failed logins.
  - Record creation, changes and deletion.
  - Configuration and permission changes.
  - Integrations and exports.
  - Administrator activity.
- **SOC 2:**
  - Cloud and SaaS providers supply current SOC 2 Type II reports.
  - IEBC will complete a SOC 2 Type I readiness assessment before any award and pursue Type II within 12 months, or deliver through a teaming partner that holds one. [Confirm this commitment before submitting.]

T-10. Integrating with external systems and CRMs

- **Standard methods:**
  - REST/JSON APIs with OAuth 2.0.
  - Webhooks.
  - SFTP with PGP-encrypted file exchange.
  - Native connectors (Salesforce, Snowflake, Tableau, Google Workspace, Smartsheet).
- **Integration approach:**
  - Each interface has a documented contract (fields, frequency, error handling, retries, and the system of record).
  - Each interface is monitored, with failed transfers alerting operations staff.
- **Unique identifiers:** a single resident ID ties calls, texts, referrals and outcomes together across systems, so duplicate intakes are visible.
- **Partner onboarding:**
  - New programs connect through a lightweight "referral endpoint" pattern. Handled's endpoint is the first example: receive referral → accept or decline → schedule → complete → outcome.
  - Small partners without APIs can use a secure web portal or Smartsheet form.

[street] · Detroit, Michigan 48219
[phone] · [email] · [website]

T-11. AI features and City AI Factsheet

All AI features are **assistive**, **optional**, and can be **switched off individually** by an authorized City administrator. **No AI feature decides eligibility, denies a service, or talks to a resident without a human in the loop.**

#	Feature	Purpose	Input data	Output	Human role	Where it runs	Off switch
AI-1	Speech transcription	Searchable record; feeds QA	Call audio	Transcript	QA staff review; transcript can be corrected	Platform service, US region	Yes. Recording continues without transcription.
AI-2	Call summary	Cut wrap-up time and improve notes	Transcript	Draft case note	Agent edits and approves before saving	Large language model in US region, no training on City data	Yes. Agents write notes manually.
AI-3	Language detection / translation of messages	Faster routing; translated texts	Caller's speech or text	Language tag; translated message draft	Templates pre-translated and reviewed by a human; free-text translations reviewed before sending	Platform service, US region	Yes
AI-4	QA flagging	Find calls needing review	Transcript, call metrics	Flags and suggested scores	QA analyst makes the final score	Platform analytics, US region	Yes. Random sampling only.
AI-5	Agent knowledge search	Find the right resource faster	Agent's question, resource inventory	Suggested resources with source links	Agent chooses what to share	Large language model over the City-approved inventory only	Yes
AI-6	Forecasting and scheduling	Staff to demand	Historical call volumes	Forecast and schedule	Workforce manager approves	Workforce-management tool	Yes

Not proposed: AI voice agents answering residents, automated eligibility decisions, and AI-chosen referrals without agent review.

T-12. AI governance

- **Human oversight:** every AI output is either a draft that a person approves (AI-2, AI-3, AI-5, AI-6) or a flag a person reviews (AI-1, AI-4). The table in T-11 names the responsible role for each.
- **Accuracy testing:**
  - Before go-live, each feature is tested on a City-approved test set. Examples: transcription word-error rate by language, and how accurate summaries are compared with agent notes.
  - Each feature has acceptance thresholds, re-tested every quarter and after any model change.
- **Bias and risk controls:**
  - Accuracy is measured separately by language and accent group.
  - Features that fall below threshold for any group are switched off for that group.

  - No protected traits are used in routing.
  - Flagging rules are reviewed for disparate impact.

- **Logging:** every AI input, output and the human edit or approval is logged with model and version.
- **Data retention:** AI inputs and outputs follow the same retention schedule as the case record. Providers are contractually barred from keeping or **training on City data**.
- **Model and provider changes:** 30 days' written notice to the City, with re-testing results before the change takes effect. The City can refuse a change and keep the feature off.
- **Ability to disable:** each feature has a City-controlled on/off switch, and the call center runs fully without AI.

T-13. Supported case management, ticketing and workflow software

System	Integration available	Method
Salesforce (Service Cloud, Public Sector)	Yes	Native connector / REST API
Snowflake	Yes	Native connector, secure data share or pipeline
Tableau	Yes	Native connector (on Snowflake or the warehouse)
Smartsheet	Yes	REST API
Google Workspace (Sheets, Forms, Drive)	Yes	Google APIs with a service account
Corteza / Pathways	Yes, subject to the API or export access the vendor provides	REST API (Corteza) / API or SFTP
SeeClickFix	Yes	REST API
Accela	Yes	Accela Construct API
Others (HMIS, ServiceNow, Microsoft Dynamics, Zendesk)	Yes	REST API, webhooks or SFTP
Handled Services	Yes	REST referral endpoint (see Part 4)

T-14. Native translation

- **IVR prompts:** English, Spanish, Arabic and Bengali, recorded by professional native speakers rather than machine-generated, because some text-to-speech engines don't support Bengali.
- **Live calls:**
  - Agents who speak Spanish and Arabic.
  - Three-way conference with a contracted phone interpreter service for Bengali and 200+ other languages, about 30 seconds to connect.
- **Text and email:** templates pre-translated into the four required languages and reviewed by human translators. Machine translation of free text, with human review before sending, is available for 70+ languages, including Bengali.

[street] · Detroit, Michigan 48219
[phone] · [email] · [website]

- **Transcription (AI-1):** depends on language support. Where a language isn't supported, recording continues and QA is done by a qualified human reviewer.

[street] · Detroit, Michigan 48219
[phone] · [email] · [website]

Part 3: Call Center Operation Questionnaire

O-1. Solution and method for screening, triage and connection

1. **Front door (IVR, under 60 seconds):**
   - Language choice.
   - Emergency shortcut for "no safe place to sleep tonight" and "being locked out or evicted today." These callers go to a priority CAM queue.
   - Short reason menu (eviction or court, rent or utility help, shelter, repairs or conditions, other) to route to skilled agents.
2. **Structured screening:**
   - A versioned decision tree asks the minimum questions to place the caller in the right stage of housing instability: at risk, imminent loss, or literally homeless (CAM).
   - It then checks for **secondary needs**: employment, benefits, inspections or conditions, legal help, utilities, and physical service needs.
3. **Best-fit match:** program eligibility rules and current capacity (openings, waitlists) show the agent the top matches. The agent confirms them with the caller.
4. **Warm handoff or referral:** live transfer where a program accepts it, otherwise an electronic referral packet with the caller's consent.
5. **Resident leaves with a text:** a summary of referrals, phone numbers, documents to gather, and the next step, in their language.
6. **Follow-up:** automated check-ins at 3 and 14 days (opt-in). Unresolved callers are re-queued for an outbound call.

O-2. Handling high demand (120,000 calls a year, 1,500-call days, waits of 5 minutes or less)

Workload math

Assumptions: about 2,750 operating hours a year, and an average handle time (AHT) of about 11 minutes. The AHT will be refined from City data during discovery.

Scenario	Calls/hour	Workload (Erlangs)	Agents on phones for 80% answered in 60 sec	Scheduled agents (≈30% shrinkage)
Average day (~440 calls)	~44	8.1	11	~15
Peak day (1,500 calls)	~150	27.5	33	~43
Peak hour on peak day	~200	36.7	42	~55 (with surge plan)

How we stay within 5 minutes without staffing every day for the peak:

- **Callback-in-queue:** after 2 minutes, callers can keep their place and get a call back. Abandoned callers get an automatic callback.

- **Forecast-driven scheduling:**
  - Staff are scheduled in 30-minute intervals.
  - Rent-due and court-calendar days are treated as known peaks.
  - Split shifts and part-time agents cover Monday mornings and the start of the month.
- **Surge plan:**
  - A trained flex pool (cross-trained partner staff) is activated when the queue passes a set threshold.
  - The IVR plays a message during surges, and self-service texts send resource lists to callers who just need information.
- **Shorter calls without cutting corners:** AI summaries (if enabled) and knowledge search are expected to save 1–2 minutes of wrap-up and lookup per call.
- **After hours:** emergencies go to the after-hours line. Everyone else gets a text and is called back next business morning, in order received.

O-3. Experience and lessons

IEBC:

- Builds AI-assisted operating systems for service businesses: intake flows, automated messaging, dashboards, approval queues, and integrations.
- Its founder has run sales and customer operations since 2001.

Handled Services: runs that model in Detroit today, including:

- Resident and business intake.
- Rules-based quoting.
- Dispatch to vetted professionals.
- Photo-verified completion with human review before anything is finalized.
- Multi-channel customer messaging.

[Teaming partner]: [years and public-sector helpline experience].

What this has taught us:

1. **Automate the paperwork, not the judgment.** Every AI step we run has a human approval point, and that's what keeps the quality high.
2. **Measure outcomes, not just calls.** A referral that never gets completed looks like success on a call report. We track whether the service happened.
3. **Make change cheap.** Rules and scripts change weekly, so they must be editable by trained staff, not developers.

We have not yet delivered a public-sector contact center of this size, and we say so plainly. That's why we propose to deliver operations with an experienced partner.

O-4. Making sure residents are identified, connected and enrolled

- **Seamless intake:** each caller's answers are captured once and reused in every referral packet, so residents aren't asked to repeat their story to each program.
- **Supportive services:** the secondary-needs screen is required, not optional, and each "yes" creates a tracked referral.
- **Waitlists:**
  - Programs share capacity and waitlist status through the integration layer.
  - Agents see whether a program is open, waitlisted or closed.
  - Waitlisted residents get automatic status texts.
- **Connected referrals:** each referral has a status (sent, accepted, scheduled, enrolled or served, declined with reason). It is reported back to the City, and referrals with no response after [5] business days are flagged.
- **Physical services (Handled):** when stability depends on a service, such as a cleanout before a move-out inspection, a repair cited by an inspector, or pest treatment, the referral goes to Handled's endpoint. The case shows the quote, scheduled date and photo-verified completion (see Part 4).

O-5. Continuous quality improvement

The cycle:

- **Weekly:** operations review of metrics and QA findings.
- **Monthly:** City performance meeting.
- **Quarterly:** script and resource-inventory review with program partners.
- Each change is logged with its reason, the expected effect and the measured result.

Examples from our own operations

1. **Pricing accuracy (Handled).** Data showed that photo-based estimates sometimes differed from the work actually done.
   - **Change:** we required photos for each service, limited how far the automated adjustment could move a price, and required a free site visit for larger changes.
   - **Result:** [measured change in price adjustments after the visit and in customer disputes].
2. **Response speed.** Lead-response data showed that inquiries answered quickly converted at much higher rates.
   - **Change:** we added instant automated acknowledgment and same-day human follow-up queues.
   - **Result:** [measured response-time change].

O-6. KPIs and compliance metrics

Category	KPI	Proposed target (to be set with the City)
Access	Calls answered or called back within 5 min	≥ 90%
Access	Abandonment rate (after 30 sec)	≤ 8%
Access	Callback completed same business day	≥ 95%

Category	KPI	Proposed target (to be set with the City)
Quality	QA score	≥ 90%
Quality	Screening completeness (required questions)	≥ 98%
Outcomes	Referrals with a known outcome within 30 days	≥ 75% (rising each year)
Outcomes	CAM intakes transmitted within 15 min	≥ 99%
Resident	Post-call satisfaction (SMS survey)	≥ 4.3 / 5
Compliance	Screening changes deployed on time (24 hr emergency / 7 days other)	100%
Compliance	Platform availability	≥ 99.99% (platform service commitment)
Compliance	Access reviews and DR test completed	Quarterly / annually
Equity	Service level and QA by language	No language group more than 10 points below average

O-7. References and evidence

- **Public-sector contact center, transition and performance:** [Teaming partner references].
- **API integrations and data management:** the Handled platform is live and in production. It includes customer and professional portals, payment and accounting integrations (Stripe, Xero), a messaging layer, and staff dashboards. A demonstration is available.
- **Security controls:** cloud and SaaS provider SOC 2 Type II reports (available under NDA), plus IEBC's security plan and the SOC 2 readiness plan in T-9.
- **AI governance:** the human-approval model described in T-11 and T-12 is already in use in Handled's operations (quotes, dispatch, QA, screening).

O-8. Staffing roles and ratios

Role	Ratio / count (at ~120k calls a year)	Notes
Housing navigator (agent)	~15 scheduled on average days, ~43 on peak days (see O-2)	Core plus part-time and flex pool. At least 25% Spanish- or Arabic-speaking.
Team lead / supervisor	1 per 12–15 agents	Real-time floor support and escalations
QA analyst	1 per 25–30 agents	Scoring, calibration, coaching inputs
Workforce manager	1	Forecasts, schedules, intraday adjustments
Trainer	1 (0.5 after launch)	New hires, script changes, refreshers
Resource and partner coordinator	1	Keeps the resource inventory current. Partner onboarding.
Program / operations manager	1	City point of contact. Reporting.
Platform administrator	1	Routing, IVR, users and script changes

[street] · Detroit, Michigan 48219
[phone] · [email] · [website]

Role	Ratio / count (at ~120k calls a year)	Notes
Integration and data engineer	0.5–1	Interfaces, warehouse, dashboards
Security and compliance lead	0.25–0.5	Access reviews, audits, incidents

City staff needed:

- **1 product owner:** a program manager, not a technical role, who approves screening and script changes and owns the resource inventory with partners.
- **About 0.25 FTE from DoIT:** security reviews, SSO setup and integration approvals.
- **No developer skills needed:**
  - Screening trees, prompts and messaging templates are edited in admin screens.
  - City admins are trained (about 2 days) and given runbooks.

Part 4: Partner capability: Handled Services referral endpoint

What it is: a way for the Helpline, or any City program, to send a resident to a vetted Detroit service professional for physical work that affects housing stability, and to get the outcome back.

Example services:

- Move-out and move-in cleaning.
- Cleanouts and junk hauling.
- Minor repairs and handyman work.
- Licensed trades (plumbing, electrical, HVAC) where licensed.
- Pest control.
- Water-damage mitigation.
- Lockouts and locksmith.
- Snow, lawn and debris removal for code compliance.

How it works:

1. The Helpline sends a referral by API or secure form: name, phone, address, service needed, urgency, consent, and the funding program if any.
2. Handled's system checks it and confirms within [2] business hours. The confirmation includes an upfront price from its pricing rules, or a free site visit for larger jobs.
3. A vetted, insured, background-checked professional is scheduled. The resident gets text updates in their language.
4. The work is completed and documented with before and after photos. A human reviews it before it is marked complete. A 30-day make-it-right guarantee applies.
5. The outcome goes back to the case record: accepted, scheduled, completed with photos, or declined with reason.

Who pays: the program or partner that funds the service. Residents are never charged without their agreement. [Confirm the pricing approach for program-funded work.]

Data handling:

- Handled receives only the fields needed to do the job.
- Data is stored in the US with role-based access.
- Data is deleted per the City's retention terms.
- Handled will not use referral data for marketing.

Part 5: Recommendations for the City's RFP

These are offered to help the City get stronger, comparable proposals:

1. **Split the award, or allow teams:** one award for technology and integration, one for operations, or a prime with named subcontractors. That opens the field to strong Detroit firms in each track.

2. **Publish baseline data:**
   - Last year's calls by interval and by reason.
   - Current AHT.
   - Abandonment.
   - Languages. Bidders can then size staffing on facts, and prices become comparable.
3. **Define the system of record for each data element**, especially for CAM and Pathways, before bidders design integrations.
4. **Buy outcome metrics, not just call metrics.** Require referral outcome reporting from receiving programs, and include partner endpoints in scope.
5. **Include the City AI Factsheet and the data classification policy** in the RFP package, so AI and security answers are complete and comparable.
6. **Allow a phased transition:** number port and platform first, then integrations, then AI features. Each phase should have a go/no-go.
